

Quick Watercolour effect in Pixelmator

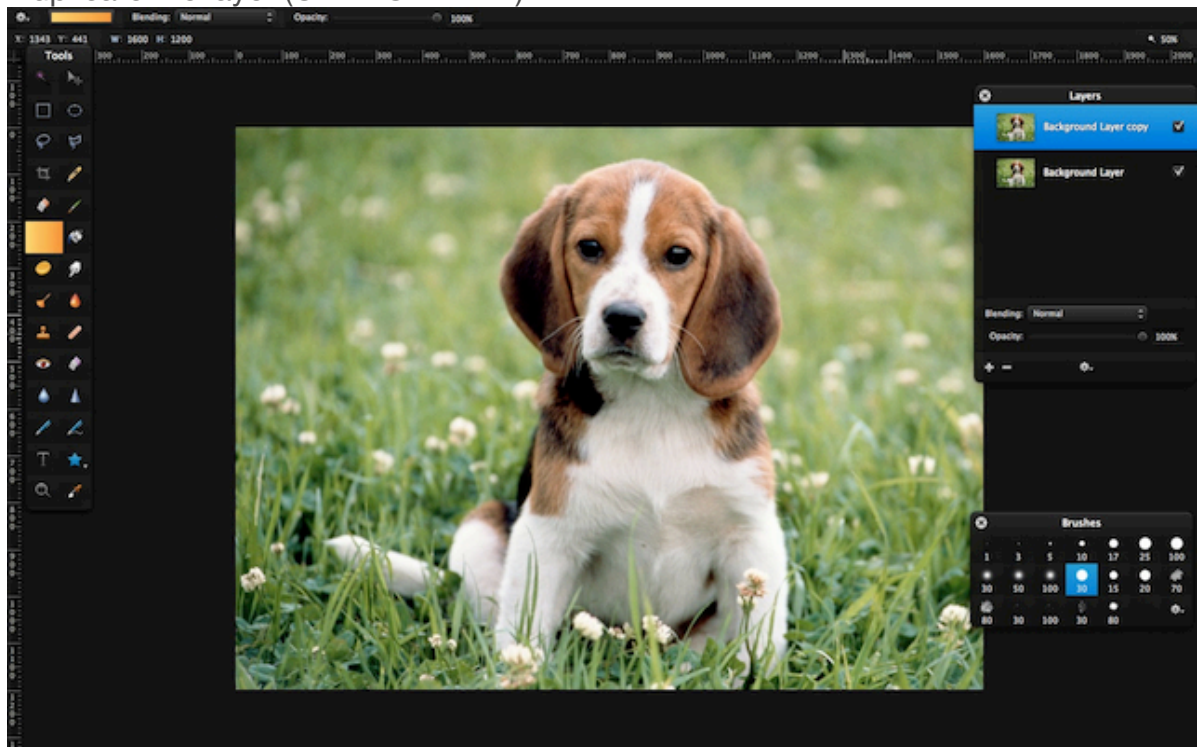

Another great beginner tutorial from Zaid where you'll learn how to create a watercolour like effect to a photograph. Blending modes and filters are on the menu this time so enjoy.

This is going to be a really quick tutorial! It is very easy!

1. Open up Pixelmator with an image you would like to apply the watercolor effect to.

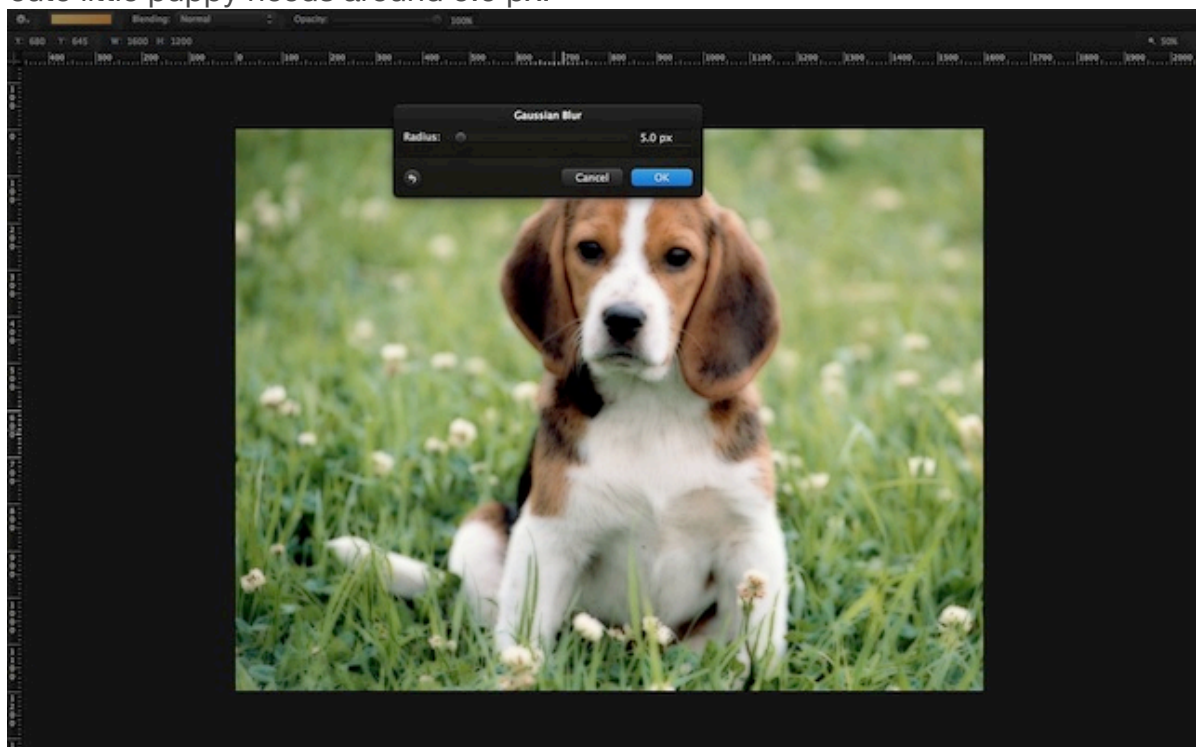

2. Duplicate the layer (CMD+SHIFT+D).

3. Change the duplicated layer's blending mode to "Darken".

4. Now go to Filter>Blur>Gaussian and set the Radius to whatever seems right. This cute little puppy needs around 5.0 px.

5. Now, you are already done! Feel free to apply more filters, whatever seems right!
